MY EMBA

MBAM601 · DIGITAL EXPERIMENT · FINAL REVIEW

myTutor

From lecture file to linked notes, without the copy and paste

HENRY NAW AUNG · 22.10.2026 · DRAFT

MY EMBA

WE LEAD CHANGE. OUR LEARNING STAYS SCATTERED.

WHY I BUILT MYTUTOR: TURNING COURSE FILES INTO A SECOND BRAIN

THE PROBLEM TODAY

TIME PER FILE BY HAND

9

MINUTES

NEW COURSE FILES EVERY DAY

~10

FILES

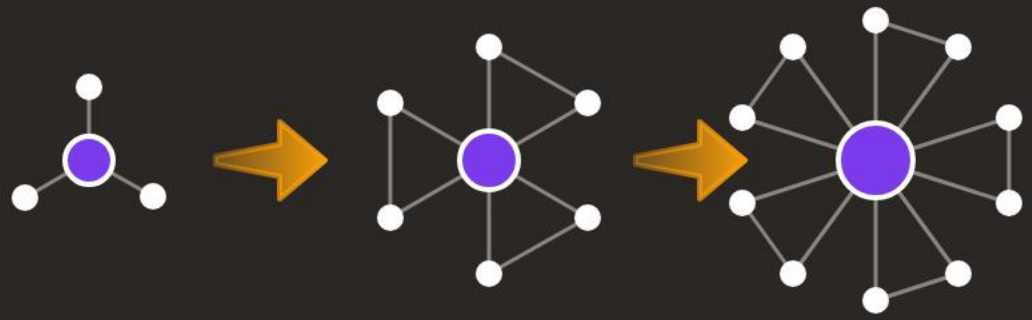

FAILED MY QUALITY CHECK

30%

OF NOTES

Linking notes by hand is the step busy leaders skip, so **insight is lost before the big decision.**

A SECOND BRAIN THAT COMPOUNDS

TODAY
this course

EMBA
every course and case

CAREER
leading change

Every lecture and case, linked and **ready when it matters**: a strategy, a transformation, a decision.

03

USER AND TASK

ONE NARROW TASK, DONE EVERY WEEK

USER

Me: an Executive MBA student on three courses a term, building an Obsidian vault to keep after graduation.

TASK

Turn each lecture deck, reading or case into notes filed in core, cases and reference, each linked to its original. ~10 sources per teaching day.

PROBLEM

Each file goes into an AI chat by hand. I retype the prompt, then copy, name, file and link every note myself. It is slow, and the results vary.

Aim: fewer minutes per source, and every note consistent, linked and self-testable.

IN SCOPE

Slides, readings and cases for my current courses, from file to filed notes.

OUT OF SCOPE

The weekly theme journal (manual by design) and meeting notes (next iteration).

USER RESEARCH · 3 QUESTIONS, 2 EMBA STUDENTS

TWO STUDENTS, SAME NEED, DIFFERENT GAPS

RESPONDENT A

WORD FOLDERS + NOTEBOOKLM

Keeps each course's files in Word, then summarises and keyword-searches them in NotebookLM.

Wants a quiz that explains each answer and links back to the topic it came from.

RESPONDENT B

CLAUDE SKILL + OBSIDIAN

Builds study sheets with a Claude "Study Sheet Skill" and already keeps them as a knowledge base.

"The knowledge is too massive… I feel like I'm just using an agent to check my library."

WHAT THIS CHANGES · N = 2, AN EARLY SIGNAL

→ Keep recall as a KPI; each quiz answer links back to its source note

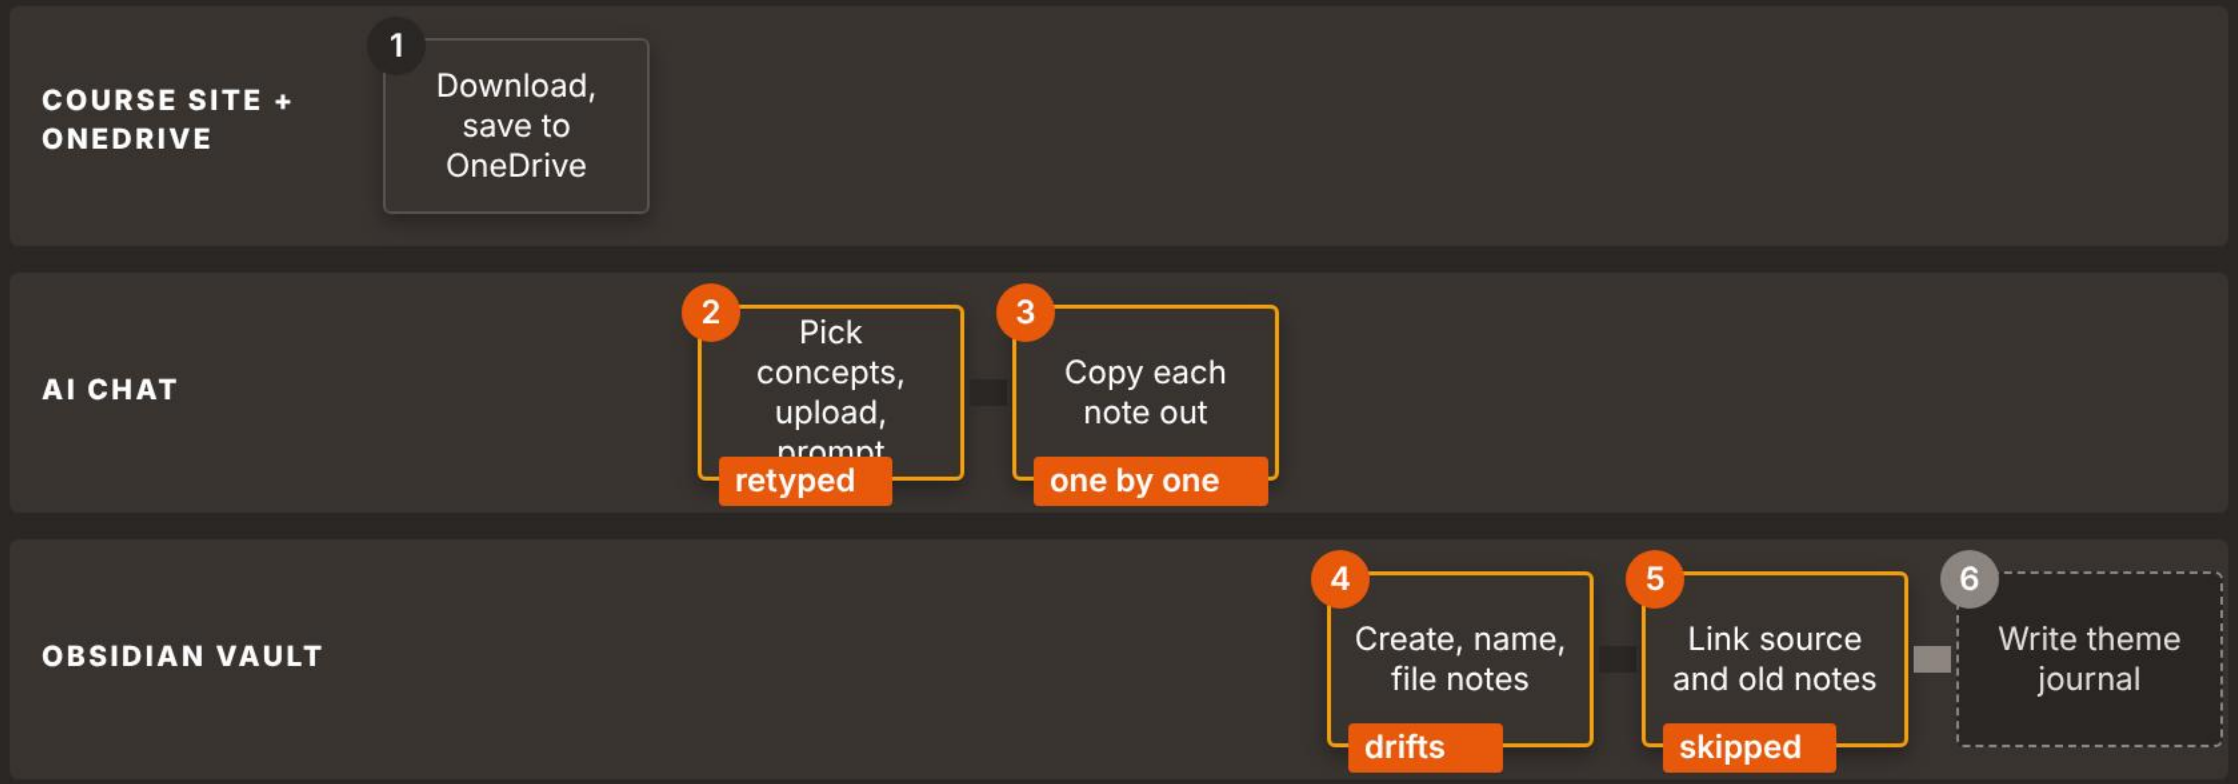

→ Baseline stays AI-assisted: both already use AI for notes

→ Retrieval across a large vault becomes the next iteration

AS IS

AS-IS: EVERY STEP BY HAND

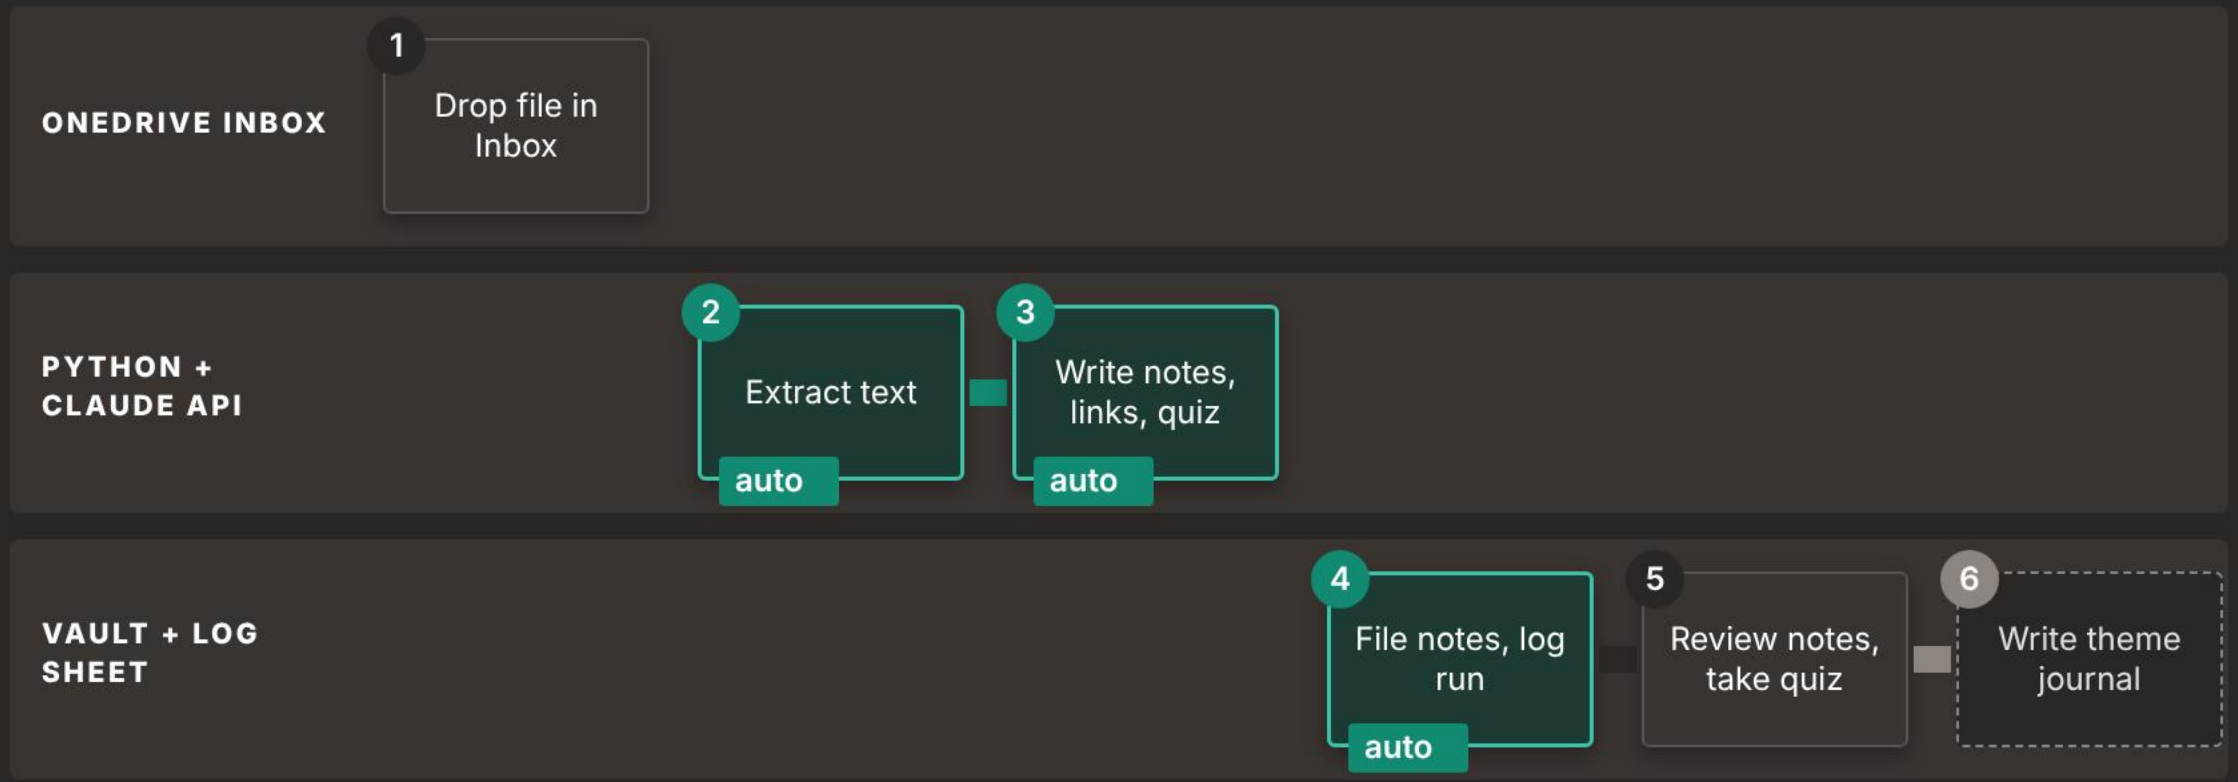

actor: me, every step
labelled steps = bottlenecks · dashed = out of scope

TO BE

TO-BE: MYTUTOR RUNS 2 TO 4

"auto" = done by myTutor
dashed = unchanged, still manual

KPIS

FOUR KPIS, ONE LOG SHEET

01 · TARGET TIME PER SOURCE

MINUTES TO FILED + REVIEWED ÷ (WORDS ÷ 1,000)

Timer, log sheet · every source · lower is better

02 · TARGET NOTE QUALITY

NOTES PASSING ALL 5 CHECKS ÷ NOTES CREATED

quality_audit.csv · 10 notes a day · 3 checks auto

03 · GUARDRAIL LINKS PER NOTE

LINKS TO EXISTING NOTES ÷ NEW NOTES

Obsidian link count · every source · higher is better

04 · GUARDRAIL RECALL

QUIZ SCORE /5, TAKEN 48 H AFTER THE NOTES

Quiz note · every source, +48 h · higher is better

→ Targets: the gains myTutor aims for · Guardrails: checks that faster notes still help me learn

BASELINE

BASELINE: FIVE DAY 9 FILES, DONE BOTH WAYS

HOW IT WAS TIMED

- Same 5 files, same note spec as myTutor
- Stopwatch from opening the file to notes filed, linked and read
- Not timed: download and reading, the same both ways
- Manual run first; myTutor run after, notes kept apart
- One new chat per file, as myTutor runs one file at a time

THE FIVE TEST FILES

File	Type	Words
Stakeholder Theory §3 and 5	reading	10,920
Kowhai Case	case	887
People and Transformation	slides	2,330
Change Management Stages	reading	350
Transformation Architecture	slides	725

Manual total: **44.5 minutes** for the 5 files, 30 notes, logged in the test workbook with a guide any tester can follow.

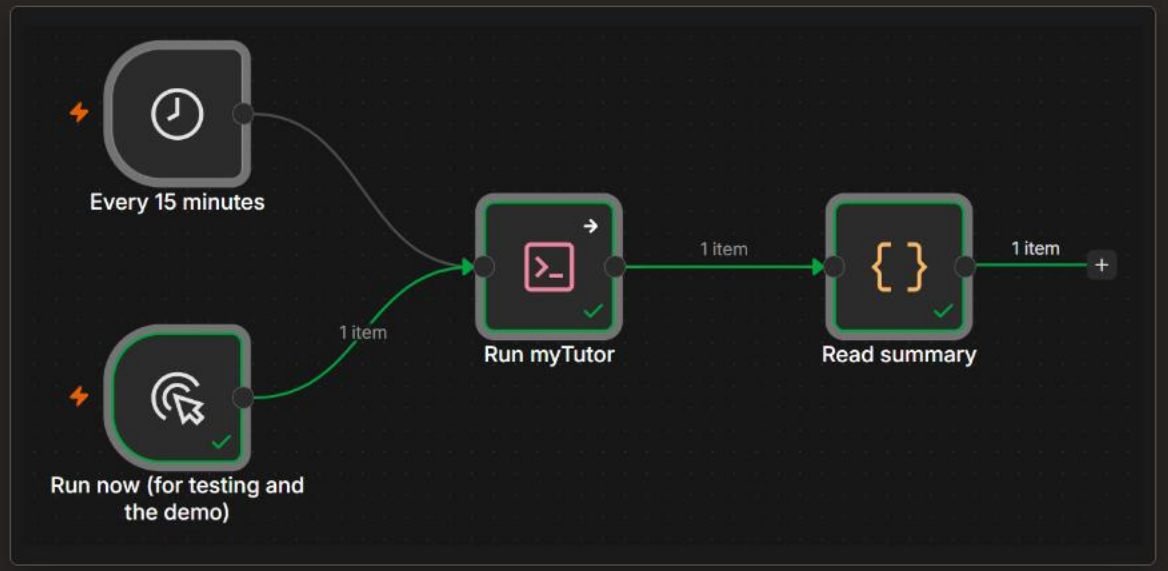

PIPELINE

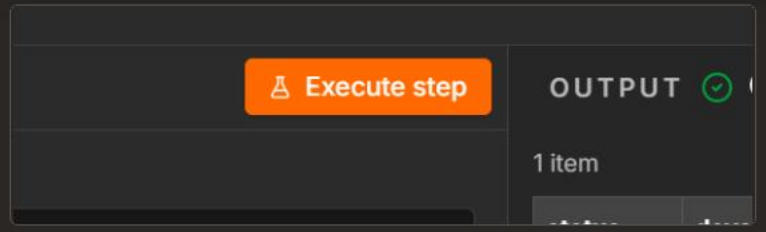

FIVE COMMANDS TURN A DAY'S FILES INTO NOTES

	COMMAND	WHAT IT DOES	FILES IT WRITES	
1	PY RETRIEVE.PY --FOLDER "…/DAY 1"	Copies the day's files from OneDrive into a dated job folder	SOURCE/ · MANIFEST.JSON · RUNS.CSV	BUILT
2	PY EXTRACT.PY --DAY "DAY 1"	Turns each PDF into clean text, counts words, guesses its kind	TEXT/*.MD · EXTRACT.JSON	BUILT
3	PY GENERATE.PY --DAY "DAY 1"	**Claude, once per source:** notes and 5 quiz questions; then the 20-question set, once	NOTES/ · QUIZ/*.JSON · GENERATE_RUNS.CSV	BUILT
4	PY FILE.PY --DAY "DAY 1" --SAMPLE 10	Files notes into my vault, never over my edits; picks 10 to spot-check	vault: Ref/ Core/ Cases/ Quizzes/ Theme/ · quality_audit.csv	BUILT
5	PY PRACTICE.PY --OPEN	Builds the offline practice page from the saved set: no AI call	PRACTICE.HTML	BUILT

SCHEDULE

N8N RUNS MYTUTOR EVERY 15 MINUTES

Test run, 24 Oct: exit code 0, status ok, nothing new

AUTOMATIC · N8N 2.44 ON MY LAPTOP

Every 15 min it runs run.py: retrieve, extract, generate, file into Obsidian, practice page. Finished files are skipped, so nothing is paid for twice.

ME · WHEN I SIT DOWN TO STUDY

Spot-check the 10 sampled notes, then study. Run through n8n so far: Day 2, 23 notes, US$0.39 · Day 3, 36 notes, US$0.47 · 0 failures

fall-back → Windows Task Scheduler runs the same command if n8n is down.

TOOLS

TOOLS IN USE, EACH WITH A FALL-BACK

01 · TRIGGER

ONEDRIVE INBOX

Files dropped here are picked up on the next check

IF IT FAILS

Not synced yet → script waits; or copy by hand

02 · WORKFLOW

N8N + PYTHON ON MY LAPTOP

n8n runs the Python steps every 15 minutes: live since 24 Oct

IF IT FAILS

n8n fails → Task Scheduler runs the same command

03 · GENERATE

CLAUDE API

Writes notes, links and quiz as JSON

IF IT FAILS

Bad output → split and retry. API down → Claude app

04 · STORE

OBSIDIAN VAULT

Notes land in my five folders as plain Markdown

IF IT FAILS

Links miss → send a cleaned title list

05 · MEASURE

CSV LOGS, OPEN IN EXCEL

One row per run and source; feeds every KPI

IF IT FAILS

Logging fails → rebuild from job .json files

data sources → course files in my OneDrive · note titles already in my vault · run log and quality audit CSVs

CONSTRAINTS

CONSTRAINTS AND FALL-BACKS

API USAGE COSTS MONEY

→ Cost is logged per run in the sheet, and a spending limit is set on the API account.

COURSE FILES GO TO AN AI SERVICE

→ Check UC's guidance on AI use before the baseline; process only my own courses' files.

SCANNED PDFS CARRY NO TEXT

→ Add an OCR step, or leave those files out and report how many were excluded.

THREE WEEKS, BUILT ALONE

→ Course sources only: decks, readings and cases. Meeting notes wait for the next iteration; the journal stays manual.

ASSUMPTIONS

Sources are text-based slides or PDFs, and my vault's note titles are consistent enough for the AI step to match them when linking.

OUTPUTS

WHAT DAY 1 ACTUALLY PRODUCED

IN MY OBSIDIAN VAULT · WHAT I STUDY

MBAM601 / DAY 1/

Ref/ 10 · one per source
Core/ 50 concepts
Cases/ 16 organisations
Quizzes/ 10 + 1 set of 20
journal 1, left for me

88 notes, in my existing Course › Day › Ref/Core/Cases layout, each linked to its original PDF.

IN THE JOB FOLDER · THE EVIDENCE

JOBS/<DATE>_DAY-1/

source/ 10 PDFs copied
text/ 10 clean texts
quiz/ 10 + practice set
manifest.json what was copied
extract.json pages, words
generate.json tokens, cost, time

Plus runs.csv and generate_runs.csv: the KPI log.

DAY 1, MEASURED 10 sources · 34,255 words → 88 notes in about 6 minutes of machine time, for US$1.01 of API use. One concept already has 14 backlinks.

MBAM622 CORE
Already in vault

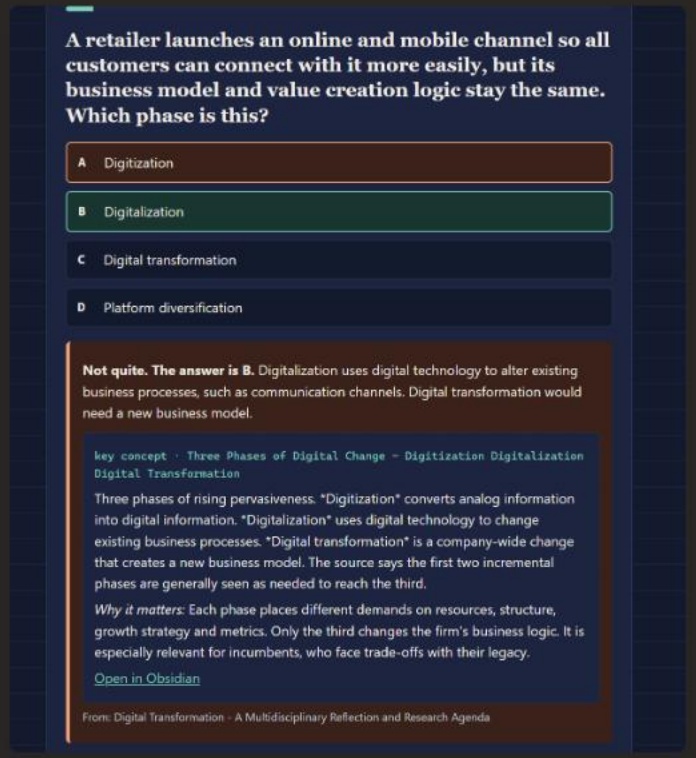

My Marketing vault, built manually: what myTutor now produces automatically

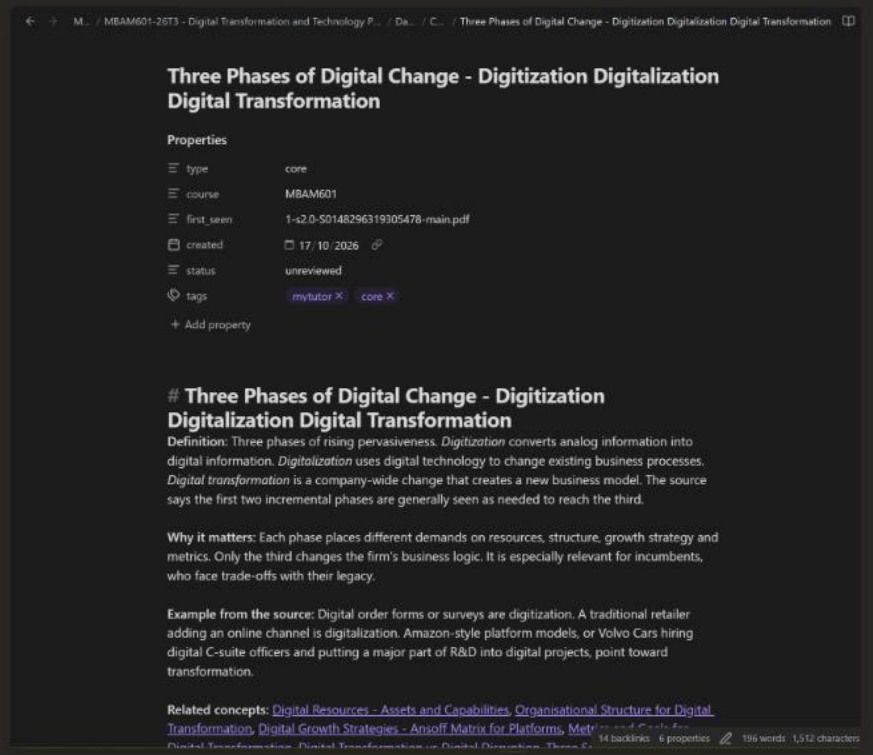

Why: write once, link everywhere · traceable · quick to review · feeds practice · mine for good. **Day 1: 88 notes; one concept already has 14 backlinks.**

PRACTICE

A WRONG ANSWER LEADS STRAIGHT BACK TO THE NOTE

Open in Obsidian

1. **Wrong answer** shows the right one
2. **Why**, in plain words
3. **Key concept**: definition and why it matters
4. **One click** to the note in my vault, with its 14 backlinks
5. **Score** copied to my recall log

Real screenshots, Day 1 · a fixed set of 20 questions built once from my readings · works offline, no AI call while I practise.

RESULTS

SAME FIVE FILES: 73% LESS TIME, 62% MORE LINKS

KPI	Manual	myTutor	Change	Better when
Total minutes, 5 files	44.5	12.1	**−73%**	lower
Minutes per 1,000 words (15,212 words)	2.92	0.80	**−73%**	lower
Links to existing notes per note	2.2	3.6	**+62%**	higher
Note quality, all 5 checks	70%	100%	**+43%**	higher
Notes made	30	34	+13%	—

CALCULATION

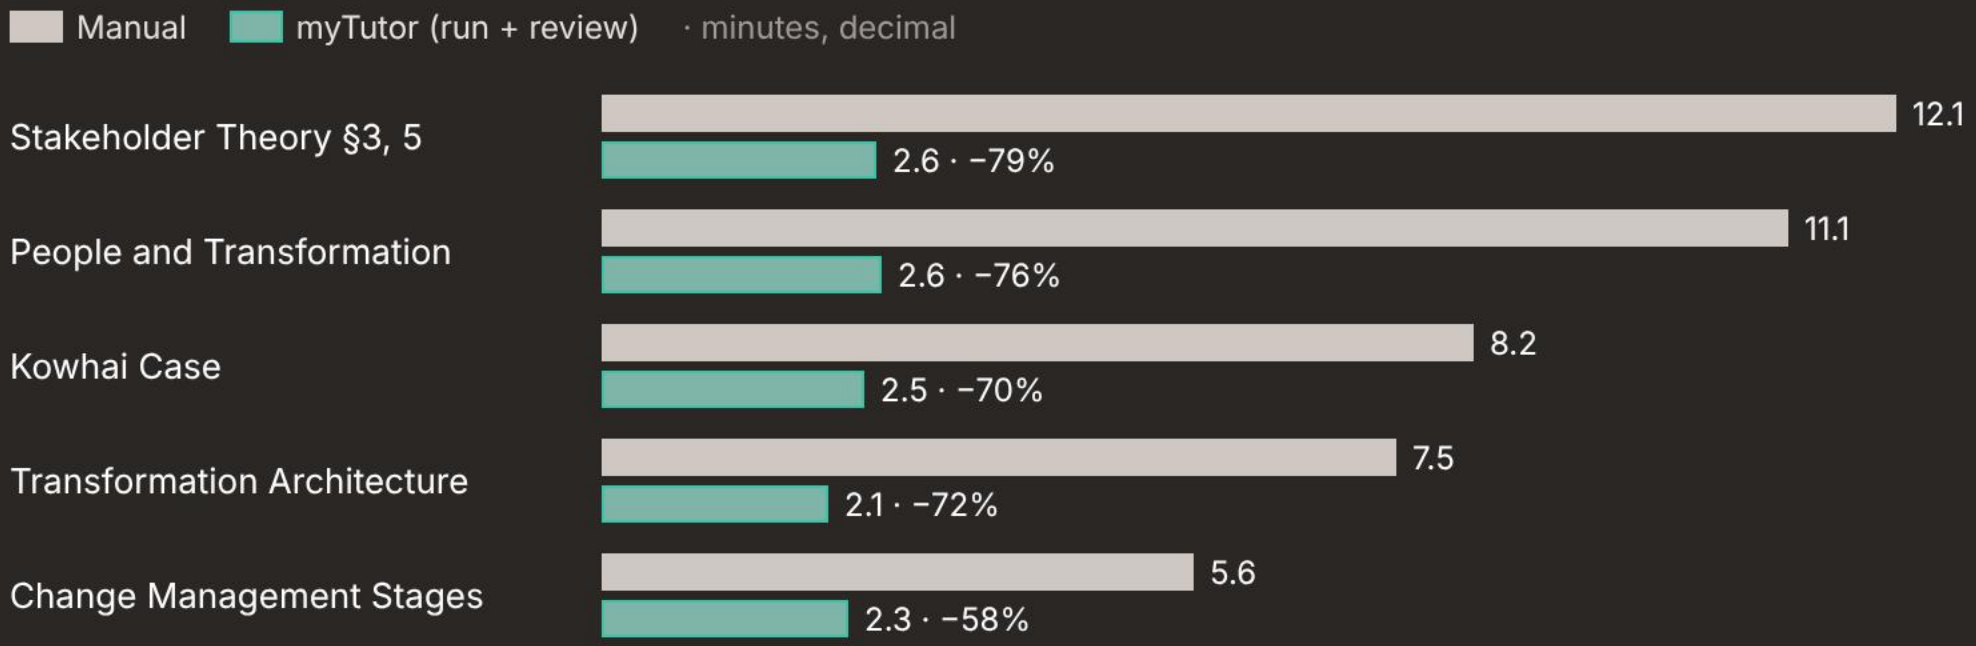

% change = (myTutor − manual) ÷ manual
(12.1 − 44.5) ÷ 44.5 = −73%
break-even: review < 1.2 min per note

WHAT MYTUTOR'S 12.1 MIN HOLDS

3.6 min run (logged) + 8.5 min review: 15 s per note, stopwatch average over the 5 files, same spot-check as manual. At 30 s: still −54%. Cost US$0.48.

PER FILE

EVERY FILE WAS QUICKER; THE SHORTEST GAINED LEAST

REFLECTION

WHAT WORKED, WHAT DIDN'T, WHAT COMES NEXT

WORKED

- 5 files in 3.8 min, US$0.48, no failures
- More links to existing notes: 3.6 vs 2.2 per note
- All 34 notes passed the 5 checks (manual: 70%)

DIDN'T

- No case note for Kowhai: prompt wants real firms
- A whole book as one file gets only 3–6 concepts
- By hand, links needed an extra relink prompt

RISKS AND LIMITS

- Review is a 15 s spot-check, not a full read
- 5 files, one tester, self-recorded times
- Course files go to an AI service: check licences

ADOPTION AND NEXT STEPS

- n8n ran Days 2 and 3, 0 failures; schedule now live
- Prompt: case notes for teaching cases too
- Split long readings by section; deeper accuracy check
